SUMMARY

Computer Science student (B.S., May 2027) with network security training (Cisco CCNA expected December 2026; full Cisco CyberOps curriculum completed with an A) and cloud engineering experience from a Fidelity Investments internship. Experienced in building secure authentication workflows, configuring network segmentation and access controls, and presenting technical systems to cross-functional stakeholders. Interested in control systems, operational technology security, and applying AI to improve how operators work. Team captain who communicates clearly across technical and non-technical groups.

EDUCATION

Southern New Hampshire University | B.S., Computer Science — Manchester, NH | May 2027

- Dean's List, Spring 2026 | Certification in progress: Cisco Certified Network Associate (CCNA), expected December 2026
- Coursework: Secure Software Development, CyberOps Associate, Full Stack Development, Data Structures and Algorithms
- Student Athlete and Team Captain | SAAC Representative | IEEE Member

EXPERIENCE

Fidelity Investments | Data Engineer Intern — June 2026 – July 2026

- Implemented secure OAuth 2.0 authentication workflows with AWS Secrets Manager to migrate cloud data into a Snowflake data warehouse.
- Built two automated, event-driven data pipelines in Python on AWS that ingested approximately 43,000 lines of real-time data per day from two external REST APIs into Amazon S3, giving users across three U.S. time zones reliable access to current data for downstream analysis.
- Presented system architectures to cross-functional stakeholder teams and translated complex cloud infrastructure logic into clear documentation that supported informed decision-making.
- Followed team coding and documentation standards and provisioned cloud resources as code using Terraform and CloudFormation, supporting consistent deployments and maintainable project documentation.
- Analyzed complex datasets with SQL in Snowflake to identify trends and insights that supported data-driven strategies.

PROJECTS

Cisco CyberOps (NetAcad) Labs — Wireshark, Kibana, Sguil, NetworkMiner

- Completed the full CyberOps curriculum with an A, as a university elective beyond the standard degree requirements.
- Investigated a simulated malware exploit by finding anomalies in Kibana, analyzing PCAPs, reviewing Sguil alerts, and tracing network traffic in Wireshark and NetworkMiner. Wrote access control lists (ACLs) and ran virtual machines in VirtualBox as part of the course labs.

Packet Tracer Network Labs — Packet Tracer, Cisco IOS CLI, VLANs, OSPF

- Built, configured, and tested simulated networks, implementing VLAN segmentation and OSPF dynamic routing from the Cisco IOS command line.

Secure Timestamp Service — Rust, Docker, Cryptography

- Built a memory-safe service in Rust that cryptographically signs file hashes to prove a file existed at a specific point in time.
- Containerized the application with Docker for an isolated, reproducible deployment with synchronized clock access for reliable time verification.

Web UI Projects — CSS, JavaScript

- Built web projects with CSS and JavaScript, designing and implementing the user interfaces, including Places Lab, an interactive map app deployed on Render where users click the map to mark places they've been (places-lab2.onrender.com).

SKILLS

Security & Networking: Network Security, Access Control Lists (ACLs), VLANs, OSPF, BGP, TCP/IP, Routing & Switching, Cisco IOS, OAuth 2.0, Cryptography, Wireshark, Kibana, Sguil

Systems & Cloud: Linux, Virtual Machines and Hypervisors (VirtualBox), Docker, AWS, Terraform, CloudFormation, Infrastructure as Code

Programming & UI: C++, C, Python, Rust, SQL, User Interface Development, REST APIs

AI: AI-assisted development, prompt engineering

Professional: Agile development, technical documentation, stakeholder presentations, cross-functional collaboration, team leadership
